

International Multi-Voltage Pump

Your iCool machine will either come with a 220 volt Davey Pump or an International Multi-voltage Pump [Marlin]. The latter is supplied for countries with 110 volt power however it can also be used with 220v power. It has a range of power settings to suit different pool sizes and hose lengths.

If you were provided with this pump, please follow instructions below on how to operate the pump and solve water flow problems:

- » When setting up your iCool, connect the pump and the Pump Controller as per the image on the right.
- » When your iCool starts up, it will automatically power this pump on its lowest power setting.
- » If you need a more powerful water flow, the power can be increased in steps by repeatedly pressing the SPEED Button.
- » This may be necessary if you are using an inflatable pool that may be restricting the water flow and the error E07 appears. The water is simply not flowing correctly and it is due to air trapped in the hoses. Your iCool machine has a water flow sensor and will shut down if this happens. Increasing the speed of the pump will solve this problem.
